Experiment 12

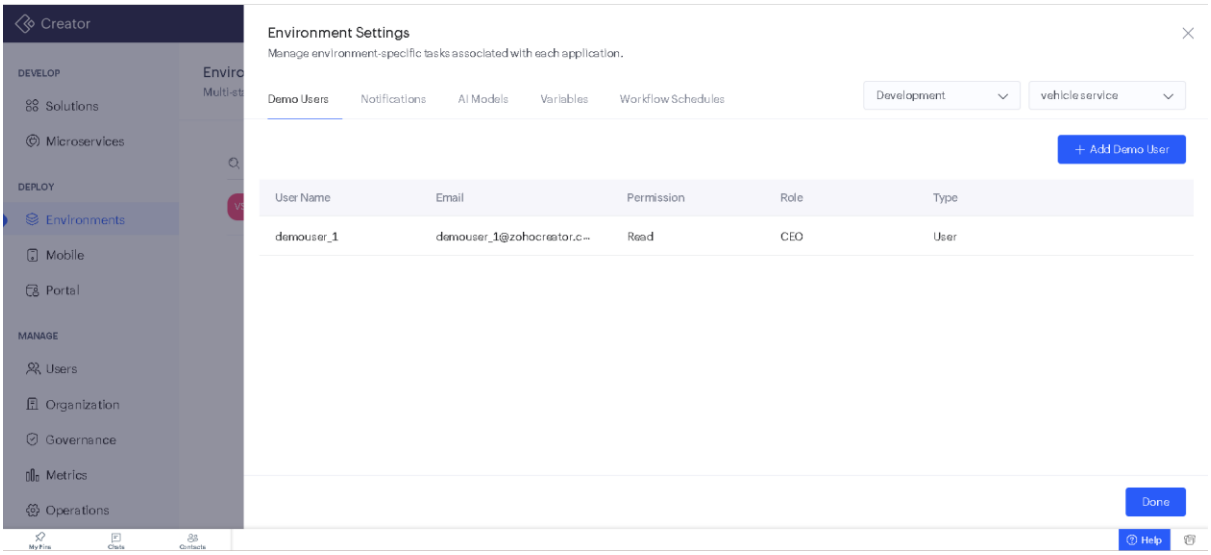

Aim

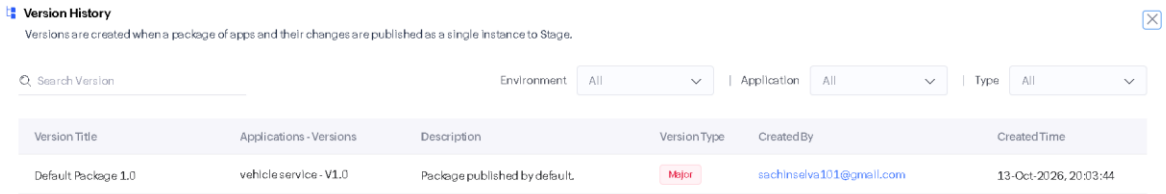

To implement security and governance in the Vehical service form using role-based access control, user permissions, data protection, and workflow restrictions to ensure that student information is accessed only by authorized users.

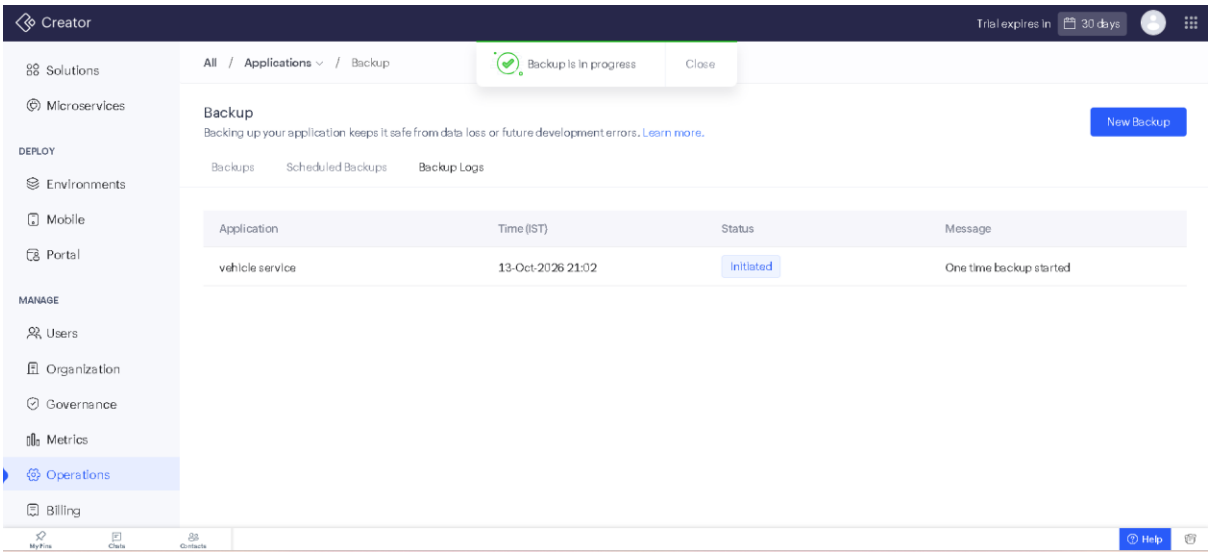

Procedure:

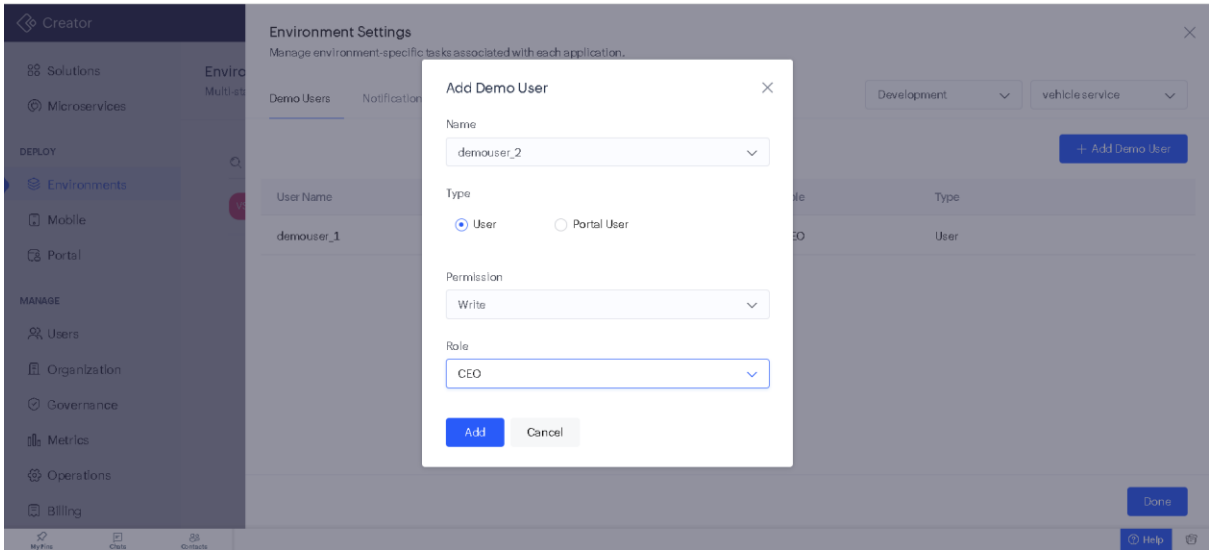

1. Open the application: Log in to Zoho Creator and open the Student Admission application.
2. Create user roles: Define roles such as Administrator,manager,supervisor
3. Configure permissions: Assign suitable permissions to each role for viewing, adding, editing, and deleting student records.
4. Restrict data access: Configure report permissions and record-level access rules to protect confidential student information.
5. Secure forms: Make essential fields mandatory and validate user inputs to prevent incomplete or invalid submissions.
6. Configure authentication: Use the available authentication settings to ensure that only authorized users can access the application.
7. Protect workflows: Review Deluge scripts, email notifications, and integrations to prevent unauthorized data access or unintended actions. 8. Audit application activity: Use available audit logs and monitoring features to review important changes and investigate suspicious activity. 9. Test security: Log in using different user roles and verify that each user can access only the features and records permitted by their assigned permissions.

Result:

Security and governance are implemented in the Zoho Creator Student Admission application by configuring user roles, access permissions, data validation, and activity monitoring.
